Let DIAGNOdent™ Shine

Prevent problems

DIAGNOdent™ is a revolutionary dental laser tool that safely and effectively detects changes that might not be visible on a traditional x-ray, even below your tooth's surface.

When this light source is directed at your tooth, anything unusual about the tooth's surface - such as the start of a cavity - causes a different type of light to be bounced back to the instrument. This light is transferred into an acoustic signal which is evaluated by a control unit. DIAGNOdent allows us to quickly catch what could later become a problem.

We want to ensure that every tooth remains yours for life. DIAGNOdent will not only reduce your need for x-rays, it will catch problems before they even get started.

Biolase Technology

Waterlase® MD

Dental researchers and scientists are constantly inventing new ways to make our dental practice more efficient and pain-free. Our practice has just acquired an amazing new invention called the *Waterlase® MD*.

What does it do? The Waterlase uses laser technology to perform a variety of dental procedures, including cavity

preparation, caries (or decay) removal, tooth etching, and a wide range of soft tissue (gum) procedures.

How does it work? The Waterlase MD system uses laser-energized water. It significantly improves your comfort in the dentist's chair, and causes no heat or vibration in your mouth, no drilling noises, or over-heating of your teeth. Remarkably, it also treats soft tissue gently and efficiently. The highly precise spray of air and laser-energized water particles, when directed at the tooth, rapidly remove enamel, dentin, and decay.

With the Waterlase MD, **most dental procedures can be performed with no pain, virtually eliminating the need for anesthesia in most cases.** The laser is very precise, so we can leave behind as much healthy tooth structure as possible. The Waterlase MD also performs numerous soft tissue (gum) procedures with little or no bleeding.

Now you can have many procedures that previously required referral to a specialist performed at our office during your regularly scheduled appointment.

We're proud to be able to offer this new technology to all our patients. Please ask us about it at your next appointment!

Don't Tell! They Won't Know!

Mini dental implants

Who wouldn't want to look better, speak better, eat better ... and smile more? Mini Dental Implants are now the first choice for many people who need to replace missing teeth or stabilize dentures.

Mini Dental Implants are FDA approved and the procedure can be performed right here in the office with only a mild anesthetic. Very strong metal implants, that are similar in diameter to a toothpick and look and act like the roots of teeth, are placed in the jaw. By modifying the patient's denture so that it can snap onto the implants tightly and reliably, many patients are able to speak and eat with confidence – for the first time in a long time.

As long-lasting as the results are, placing Mini Dental Implants takes only about an hour. Because the procedure is minimally invasive,

Overdenture anchored to a dental implant

and the implants are tiny, there is no healing period after placement and no stitches are required. The denture can be snapped in immediately. In fact, most patients are able to eat a light meal within only an hour or so after having the mini implants placed.

An additional welcome benefit to patients is the ease of home hygiene care. With a little practice, the denture is easy to remove and replace.

With Mini Dental Implants, your friends won't know how you're looking so good – but you'll feel so great you might just want to tell them!
